Deformation Quantization - Gilles Halbout
2002

This book contains eleven refereed research papers on deformation quantization by leading experts in the respective fields. These contributions are based on talks presented on the occasion of the meeting between mathematicians and theoretical physicists held in Strasbourg in May 2001. Topics covered are: star-products over Poisson manifolds, quantization of Hopf algebras, index theorems, globalization and cohomological problems. Both the mathematical and the physical approach ranging from asymptotic quantum electrodynamics to operads and prop theory will be presented. Historical remarks and surveys set the results presented in perspective. Directed at research mathematicians and theoretical physicists as well as graduate students, the volume will give an overview of a field of

research that has seen enormous activity in the last years, with new ties to many other areas of mathematics and physics.

for a conference under the auspices of European Women in Mathematics (EWM). These contributions serve as excellent surveys of their subject areas, including symplectic topology, combinatorics and number theory. The volume moreover sheds light on prominent women mathematicians who worked in Cambridge in the late 19th and early 20th centuries by providing an insightful historical introduction at the beginning of the volume. The volume concludes with short contributions from women mathematicians from across Europe working in various areas of mathematics ranging from group theory to magnetic fields.

Geometric and Topological Methods for Quantum Field Theory - Bo Summer School Geometric and Topological Methods for Quantum 2007

This volume, based on lectures and short communications at a summer school in Villa de Leyva, Colombia (July 2005), offers an introduction to some recent developments in several active topics at the interface between geometry, topology and quantum field theory. It is aimed at graduate students in physics or mathematics who might want insight in the following topics (covered in five survey lectures):

Anomalies and noncommutative geometry, Deformation quantisation and Poisson algebras, Topological quantum field theory and orbifolds. These lectures are followed by nine articles on various topics at the borderline of mathematics and physics ranging from quasicrystals to invariant instantons through black holes, and involving a number of mathematical tools borrowed from geometry, algebra and analysis.

Algebraic and Classical Topology - I. M. James 2014-05-09

Algebraic and Classical Topology contains all the published mathematical work of J. H. C. Whitehead, written between 1952 and 1960.

This volume is composed of 21 chapters, which represent two groups of papers. The first group, written between 1952 and 1957, is principally concerned with fiber spaces and the Spanier-Whitehead S-theory. In the second group, written between 1957 and 1960, Whitehead returns to classical topology after a long interval, and participates in the renewed assault on the problems which fascinated him most. This book will prove useful to mathematicians.

Observer's Guide to Stellar Evolution - Mike Inglis 2012-12-06

Stellar evolution - the birth, development and death of stars - is central to our current understanding of astronomy, but surprisingly the majority of amateur astronomers lack a full understanding of the physics of stars. Current books on the market tend to be highly theoretical and off-putting, in *Observer's Guide to Stellar Evolution*, Mike Inglis brings this subject to life in a unique way. By combining a step-by-step introduction with suggestions for practical observations of stars at different stages in their evolution, amateur astronomers regardless of their current level of knowledge, will find this book fascinating and informative. - Accessible to every amateur astronomer, regardless of background knowledge. - Step-by-step introduction to the theory of stellar evolution. - Includes many examples of stars at different stages in their evolution, that the reader can observe for him/herself. - Mathematics is made accessible by being presented in 'boxes' that readers can skip over if they prefer!

Conférence Moshé Flato 1999 - Giuseppe Dito 2000-07-31

These two volumes constitute the Proceedings of the 'Conférence Moshé Flato, 1999'. Their spectrum is wide but the various areas covered are, in fact, strongly interwoven by a common denominator, the unique personality and creativity of the scientist in whose honor the Conference was held, and the far-reaching vision that underlies his scientific activity. With these two volumes, the reader will be able to take stock of the present state of the art in a number of subjects at the frontier of current research in mathematics, mathematical physics, and physics. Volume I is prefaced by reminiscences of and tributes to Flato's life and work. It also includes a section on the applications of sciences to insurance and finance, an area which was of interest to Flato before it became fashionable. The bulk of both volumes is on physical mathematics, where the reader will find these ingredients in various combinations, fundamental mathematical developments based on them, and challenging interpretations of physical phenomena. Audience: These volumes will be of interest to researchers and graduate

students in a variety of domains, ranging from abstract mathematics to theoretical physics and other applications. Some parts will be accessible to proficient undergraduate students, and even to persons with a minimum of scientific knowledge but enough curiosity.

Quantum Theory, Deformation and Integrability - R. Carroll 2000-11-09

About four years ago a prominent string theorist was quoted as saying that it might be possible to understand quantum mechanics by the year

2000. Sometimes new mathematical developments make such understanding appear possible and even close, but on the other hand, increasing lack of experimental verification make it seem to be further distant. In any event one seems to arrive at new revolutions in physics and mathematics every year. This book hopes to convey some of the excitement of this period, but will adopt a relatively pedestrian approach designed to illuminate the relations between quantum and classical. There will be some discussion of philosophical matters such as measurement, uncertainty, decoherence, etc. but philosophy will not be emphasized; generally we want to enjoy the fruits of computation based on the operator formulation of QM and quantum field theory. In Chapter 1 connections of QM to deterministic behavior are exhibited in the trajectory representations of Faraggi-Matone. Chapter 1 also includes a review of KP theory and some preliminary remarks on coherent states, density matrices, etc. and more on deterministic theory. We develop in Chapter 4 relations between quantization and integrability based on Moyal brackets, discretizations, KP, strings and Hirota formulas, and in Chapter 2 we study the QM of embedded curves and surfaces illustrating some QM effects of geometry. Chapter 3 is on quantum integrable systems, quantum groups, and modern deformation quantization. Chapter 5 involves the Whitham equations in various roles mediating between QM and classical behavior. In particular, connections to Seiberg-Witten theory (arising in $N = 2$ supersymmetric (susy) Yang-Mills (YM) theory) are discussed and we would still like to understand more deeply what is going on. Thus in Chapter 5 we will try to give some conceptual background for susy, gauge theories, renormalization, etc. from both a physical and mathematical point of view. In Chapter 6 we continue the deformation quantization then by exhibiting material based on and related to noncommutative geometry and gauge theory. **Quasicrystals and Discrete Geometry** - Jiri Patera 1998-01-01

Comprising the proceedings of the fall 1995 semester program arranged by The Fields Institute at the U. of Toronto, Ontario, Canada, this volume contains eleven contributions which address ordered aperiodic systems realized

either as point sets with the Delone property or as tilings of a Euclidean space. This collection of articles aims to bring into the mainstream of mathematics and mathematical physics this developing field of study integrating algebra, geometry, Fourier analysis, number theory, crystallography, and theoretical physics.

Set Your Phaser to Stun - Steve Pearse

2011-08-22

Book Summary This book is a scientific investigation into the Extraterrestrial Hypothesis, which demonstrates beyond a reasonable doubt that we are being visited by extraterrestrial Beings from another World. This story involves two unrelated cases of abduction. The first case is the well known Betty and Barney Hill case that was published in *The Interrupted Journey* in 1961, and *Captured* in 2007. The second case involves a married couple named Kay and Erik Wilson whose experiences were published in *The Alien Jigsaw* in 1993 and its accompanying *Researcher's Supplement* in 1994. Information from both of these cases have been merged together to prove that the star map that Betty Hill drew was not only real, but it was actually Earth based. The Wilson case proved to be the key in unlocking the door. Like Betty Hill, once again, a brave soul had the courage to ask the Beings where they come from; and as a result of this unique one on one conversation between Erik Wilson and a Grey, without realizing it, he was given major clues to find their home world. *Set Your Phaser To Stun!* reveals that Betty's star map is real and the Extraterrestrial Hypothesis has been purposely skewed to deceive the public. When Carl Sagan involved himself in this dispute many years ago, he claimed Betty's star map only showed meaningless random dots, which were not specific points of reference for any known stars. This book proves that Sagan was wrong and was involved in what some people claim to be scientific misconduct relating to the UFO subject. The stars that Betty Hill drew of the star map she was shown in 1961 are anything but random. *Set Your Phaser To Stun!* takes a fresh new look at the Betty and Barney Hill case and examines previous interpretations of the star map, with particular emphasis on Marjorie

Fish's Zeta Reticuli Interpretation. This new research, which began in the year 2000, uncovers the fact that some of our closest neighborhood stars are linked in a network of trade and exploration by a highly advanced extraterrestrial civilization that is less than 50 light years away from us. The real shock is the location of Sol, our sun, and the role humans play in the aliens' agenda. For far too long the establishment has systematically denied the Extraterrestrial Hypothesis has any substance. This opinionated stance has been based on the urgent need to control the dissemination of news that they feared would ultimately damage the fabric of our society should it be released. An extreme political drama of the highest order has been blocking disclosure. The Military Industrial Complex has been unwilling to relinquish control to civilian authorities and there is a grave fear that disclosure will have a severe, negative impact on our Religious Institutions worldwide. They fear allowing the public access to information which would severely challenge the traditional belief that humanity is unique and has a special relationship to God. The official position on this subject is based upon the idea that society is not prepared to handle the psychological impact of the knowledge that we are not alone in the universe. They have even gone so far as resorting to scientific misconduct because they are deeply afraid of possible societal upheaval. Fortunately, in May of 2008, a remarkable turn of events occurred within the Catholic Church when astronomer Father Gabriel Funes wrote in the Vatican Newspaper that "intelligent beings created by God could exist in outer space." He moved further toward official legitimization of the acceptance of other life by calling the aliens our "Brothers and Sisters." This was the beginning of a slow and well planned acclimation process of one billion Catholics worldwide. It has often been stated that we would have to rewrite history if contact with an alien civilization ever took place. *Set Your Phaser To Stun!* is the beginning of that process.

The Emergence of Astrophysics in Asia - Tsuko Nakamura 2017-11-03

This book examines the ways in which attitudes toward astronomy in Australia, China, India, Indonesia, Japan, South Korea, New Zealand, Taiwan, Thailand and Uzbekistan have changed with the times. The emergence of astrophysics was a worldwide phenomenon during the late nineteenth and early twentieth centuries, and it gradually replaced the older-style positional astronomy, which focused on locating and measuring the movements of the planets, stars, etc.. Here you will find national overviews that are at times followed by case studies of individual notable achievements. Although the emphasis is on the developments that occurred around 1900, later pioneering efforts in Australian, Chinese, Indian and Japanese radio astronomy are also included. As the first book ever published on the early development of astrophysics in Asia, the authors fill a chronological and technological void. Though others have already written about earlier astronomical developments in Asia, and about the recent history of astronomy in various Asian nations, no one has examined the emergence of astrophysics, the so-called 'new astronomy' in Asia during the late nineteenth and early twentieth centuries.

A Textbook of Geography For ICSE Schools for Class 6 (Includes the Essence of NEP 2020) - VEENA BHARGAVA 2022-01-01

A Textbook of Geography For ICSE Schools for Class 6 (Includes the Essence of NEP 2020) We are pleased to present the series A Textbook of Geography for Classes 6 to 8. This series has been written in strict conformity with the latest curriculum. The new curriculum deals with the development of children's understanding and appreciation of the world through a continuous

interaction and exploration of the natural and human environment. It also aims at encouraging children to appreciate the interdependence of individuals, groups and communities and promotes a healthy respect for different types of cultures and ways of life of people around the world. This series endeavors to introduce the practical aspect of the subject, along with the text, through appropriate Diagrams, Pictures, Maps, Mind Maps (graphic organizers) and latest updates in the field of Geography. The series has been specially designed for the young learners to make the learning experience both enjoyable and informative. The salient features of the books in this series are - 1. Simple, lucid and student friendly language with scientific, logical and practical approach. 2. Precise and to-the-point contents are given to avoid unnecessary details. 3. Maps and diagrams have been kept simple and clear. 4. In most cases there are separate maps for different types of information instead of providing them in one map. 5. Map skills in regional geography play an important role in understanding the subject as well as laying foundation for the future Examinations. For all the continents covered in curriculum, Self Explanatory Colorful Maps with consolidated information have been given. For the convenience of the students and teachers, Practice Maps have been provided. 6. Colorful Mind Maps at the end of each lesson, give the gist of the lesson at a glance and are ideal for a quick revision. 7. Worksheets under Classwork have been introduced to comprehend the lesson. These are to be solved under the direct supervision of the teacher. 8. Comprehensive Exercise at the end of chapter contains all types of questions to consolidate learning. 9. Teacher's Resource Book containing answers of the exercise given at the back of each lesson is available. The present set of books for classes 6, 7 and 8 is a continuation of my existing series of ICSE Geography for classes 9 and 10. This is a genuine effort to maintain the continuity in the ICSE syllabus from Classes 6 to 10 and prepare the students for the oncoming Board Examinations, right from class 6 onward. I hope to succeed in inculcating the interest and confidence amongst the students by providing the required guidance to achieve their ultimate goals. Any suggestions for improvement of the

books are most welcome. -Author Goyal Brothers Prakashan

In Quest of the Stars and Galaxies - Theo

Koupelis 2010-02-04

Available with WebAssign! Author Theo Koupelis

has set the mark for a student-friendly, accessible introductory astronomy text with *In Quest of the Universe*. He has now developed a new text to accommodate those course that focus mainly on stars and galaxies. Ideal for the one-term course, *In Quest of the Stars and Galaxies* opens with material essential to the introductory course (gravity, light, telescopes, the sun) and then moves on to focus on key material related to stars and galaxies.

Incorporating the rich pedagogy and vibrant art program that have made his earlier books a success, Koupelis' *In Quest of the Stars and Galaxies* is the clear choice for students' first exploration of the cosmos.

A Quantum Kirwan Map: Bubbling and Fredholm Theory for Symplectic Vortices over the Plane - Fabian Ziltener 2014-06-05

Consider a Hamiltonian action of a compact connected Lie group on a symplectic manifold. Conjecturally, under suitable assumptions there exists a morphism of cohomological field theories from the equivariant Gromov-Witten theory of to the Gromov-Witten theory of the symplectic quotient. The morphism should be a deformation of the Kirwan map. The idea, due to D. A. Salamon, is to define such a deformation by counting gauge equivalence classes of symplectic vortices over the complex plane. The

present memoir is part of a project whose goal is to make this definition rigorous. Its main results deal with the symplectically aspherical case.

Cellular Structures in Topology - Rudolf Fritsch 1990-09-27

This book describes the construction and the properties of CW-complexes. These spaces are important because firstly they are the correct framework for homotopy theory, and secondly most spaces that arise in pure mathematics are of this type. The authors discuss the foundations and also developments, for example, the theory of finite CW-complexes, CW-complexes in relation to the theory of fibrations, and Milnor's work on spaces of the type of CW-complexes. They establish very clearly the relationship between CW-complexes and the theory of simplicial complexes, which is developed in great detail. Exercises are provided throughout the book; some are straightforward, others extend the text in a non-trivial way. For the latter; further reference is given for their solution. Each chapter ends with a section sketching the historical development. An appendix gives basic results from topology, homology and homotopy theory. These features will aid graduate students, who can use the work as a course text. As a contemporary reference work it will be essential reading for the more specialized workers in algebraic topology and homotopy theory.
