**Temporomandibular Disorders** - National Academies of Sciences, Engineering, and Medicine 2020-07-01

Temporomandibular disorders (TMDs), are a set of more than 30 health disorders associated with both the temporomandibular joints and the muscles and tissues of the jaw. TMDs have a range of causes and often co-occur with a number of overlapping medical conditions, including headaches, fibromyalgia, back pain and irritable bowel syndrome. TMDs can be transient or long-lasting and may be associated with problems that range from an occasional click of the jaw to severe chronic pain involving the entire orofacial region. Everyday activities, including eating and talking, are often difficult for people with TMDs, and many of them suffer with severe chronic pain due to this condition. Common social activities that most people take for granted, such as smiling, laughing, and kissing, can become unbearable. This dysfunction and pain, and its associated suffering, take a terrible toll on affected individuals, their families, and their friends. Individuals with TMDs often feel stigmatized and invalidated in their experiences by their family, friends, and, often, the health care community. Misjudgments and a failure to understand the nature and depths of TMDs can have severe consequences - more pain and more suffering - for individuals, their families and our society. Temporomandibular Disorders: Priorities for Research and Care calls on

a number of stakeholders - across medicine, dentistry, and other fields - to improve the health and well-being of individuals with a TMD. This report addresses the current state of knowledge regarding TMD research, education and training, safety and efficacy of clinical treatments of TMDs, and burden and costs associated with TMDs. The recommendations of Temporomandibular Disorders focus on the actions that many organizations and agencies should take to improve TMD research and care and improve the overall health and well-being of individuals with a TMD.

**Apoptosis in Immunology** - Guido Kroemer 2012-12-06

In any movement of their life, immune cells, especially T and B lymphocytes, are confronted with an essential choice: to continue their existence or to commit a sort of metabolic suicide that is referred to as apoptosis or programmed cell death. In contrast to most philosophers, lymphocytes and their precursors are constantly susceptible to suicide, and it even appears that the usual cause of T or B cell elimination is suicide rather than death from natural causes, accidents or murder. This book provides a vast overview of lymphocyte suicide: external triggers and internal motives leading to suicidal impulses, accomplices in self-destruction, weapons implicated in self-execution, removal of dead bodies and pharmacological prevention of suicide. Most of the chapters in this book are devoted to the physiology of apoptosis. The goal is to unmask the external triggers of apoptosis, unravel the signal transduction processes involved therein and describe the role of oncogenes, "death genes" and effector molecules in the apoptotic cascade. The remaining chapters deal with the pathophysiological aspects of lymphocyte apoptosis, namely, as a host contribution to HIV-induced lymphopenia, and therapeutic strategies for the avoidance of lymphocyte death. We are confident that this compendium will contribute to the exploration of cellular suicide, not only from a basic scientist's viewpoint but also with regard to the possible clinical implications of apoptosis (dys)regulation. Far from having a depressing effect on the reader, cellular suicide may thus provide a source of both intellectual excitement and therapeutic inspiration.
