Configuring and Deploying Open Source with IBM WebSphere Application Server Liberty Profile - Rufus Credle 2015-07-21

This IBM® Redbooks® publication explains the capabilities of IBM WebSphere® Application Server Liberty profile (Liberty profile), which is lightweight, easy to install, and fast to use. Liberty profile provides a convenient and capable platform for developing and testing your web and OSGi applications. The Liberty profile server is built by using OSGi technology and concepts. The fit-for-purpose nature of the run time relies on the dynamic behavior that is inherent in the OSGi framework and service registry. As bundles are installed or uninstalled from the framework, their services are automatically added or removed from the service registry. The result is a dynamic, composable run time that can be provisioned with only what your application requires and responds dynamically to configuration changes as your application evolves. This book can help you install, customize, and configure several popular open source technologies that can be deployed

effectively with the Liberty profile server. The following popular open source toolkits for the Liberty profile server were selected for this book based on the significant enhancements they provide to the web application development process: Apache Maven Spring Framework Hibernate Jenkins Opscode Chef Arquillian MongoDB In this book, the Todo sample demonstrates the use of multiple open source frameworks or toolkits with the Liberty profile server, including Maven, MongoDB, Spring, JPA, Arquillian, Wicket, and others. The Todo sample is a simple application that can be used to create, update, and delete todo items and todo lists, and put the todo items into a related todo list.

straightforward performance optimization that can be performed with a minimum of effort and without extensive previous experience or in-depth knowledge. The POWER8 processor contains many new and important performance features, such as support for eight hardware threads in each core and support for transactional memory. The POWER8 processor is a strict superset of the IBM POWER7+™ processor, and so all of the performance features of the POWER7+ processor, such as multiple page sizes, also appear in the POWER8 processor. Much of the technical information and guidance for optimizing performance on POWER8 processors that is presented in this guide also applies to POWER7+ and earlier processors, except where the guide explicitly indicates that a feature is new in the POWER8 processor. This guide strives to focus on optimizations that tend to be positive across a broad set of IBM POWER® processor chips and systems. Specific guidance is given for the POWER8 processor; however, the general guidance is applicable to the IBM POWER7+, IBM POWER7®, IBM POWER6®, IBM POWER5, and even to earlier processors. This guide is directed at personnel who are responsible for performing migration and implementation activities on POWER8 processor-based systems. This includes system administrators, system architects, network administrators, information architects, and database administrators (DBAs).

Pattern-based Evaluation of IBM

WebSphere BPEL - Volker Kramberg

2008-06-23

Inhaltsangabe: Abstract: There are numerous Business Process Execution Language (BPEL)

modeling tools available on the market today that differ in their power and ability to transform patterns into executable BPEL code. Examples for commercially available tools are ActiveBPEL [5], Oracle-BPEL [12] and IBM WebSphere Integration Developer [3]. Patterns describe business requirements and thus define the needs in workflow languages and their related modeling tools. Patterns are used as a basis to compare these tools. In this student research paper should be examined to which extend the control-flow patterns presented in [1] are supported by IBM WebSphere Integration Developer V6.0 [3] on IBM WebSphere Process Server for Multiplatforms V6.0 [4]. IBM WebSphere Integration Developer uses the Business Process Execution Language for Web Services version 1.1 (BPEL4WS) [2, 7] as the basis but already implements functionality of WS-BPEL version 2.0. Control-flow patterns include basic control patterns, patterns involving multiple instances, state-based patterns and cancellation patterns. Extensive surveys of control-flow patterns have been made in [10] and [11]. The BPEL and the Web Service Description Language (WSDL) source code of the implementations are listed in the appendix. Assign activities are mostly used as placeholders for comprehensive business logic and if this is not the case, they are explained in detail.

[z/OS: WebSphere Business Process Management
V7 Production Topologies](#) - Martin Keen
2010-06-07

In this IBM® Redbooks® publication, we
address the configuration, administration, and
security of the key runtime environments in
business process management: WebSphere®
Process Server V7.0 and WebSphere Business
Services Fabric V7.0 for z/OS®. This book

provides detailed guidance to z/OS system and
database administrators who want to configure
WebSphere Business Process Management
production topologies. We introduce production
topology concepts and terminology and explore
the differences between production topologies
on distributed platforms and z/OS. Through a
series of step-by-step instructions, you will learn
how to create and verify a production topology
environment for WebSphere Process Server V7
for z/OS. We extend the production topology
concept for WebSphere Process Server by
describing step-by-step how to add WebSphere
Business Services Fabric V7 for z/OS into the
topology. You also get problem diagnosis and
prevention guidance to use when you create
your own production topologies. A separate
publication that covers distributed platforms is
also available: "WebSphere Business Process
Management V7 Production Topologies,"
SG24-7854.
