Edible Oleogels - Alejandro G. Marangoni 2015-08-24

In an effort to provide alternatives to trans and saturated fats, scientists have been busy modifying the physical properties of oils to resemble those of fats. In this fashion, many food products requiring a specific texture and rheology can be made with these novel oil-based materials without causing significant changes to final product quality. The major approach to form these materials is to incorporate specific molecules (polymers, amphiphiles, waxes) into the oil components that will alter the physical properties of the oil so that its fluidity will decrease and the rheological properties will be similar to those of fats. These new oilbased materials are referred to as oil gels, or "oleogels," and this emerging technology is the focus of many scientific investigations geared toward helping decrease the incidence of obesity and cardiovascular disease. Presents a novel strategy to eliminate trans fats from our diets and avoid excessive amounts of saturated fat by structuring oil to make it behave like crystalline fat. Reviews recent advances in the structuring of edible oils to form new mesoscale and nanoscale structures, including nanofibers, mesophases, and functionalized crystals and crystalline particles. Identifies evidence on how to develop trans fat free, low saturate functional shortenings for the food industry that could make a major impact on the health characteristics of the foods we consume.

Policy framework for contract farming: An alternate to Aarathi system in

Pakistan - Rana, Abdul Wajid 2023-01-27

Global agricultural production is undergoing a remarkable shift due to globalization and market liberalization (Setboonsarng et al., 2008). Food markets are transforming from a 'non-programmed to programmed' regime stemming from overwhelming changes in demand patterns happening concurrently with variations in production dynamics internationally (Oostendorp, 2018). This presents both the challenge and opportunity to change and adapt to this more structured world to reap benefits for both smallholder farmers and exporters (Setboonsarng et al., 2008).

Global Intellectual Property Protection and New Constitutionalism - Jonathan Griffiths 2022-02-14

The constitutionalization of intellectual property law is often framed as a benign and progressive integration of intellectual property with fundamental rights. Yet this is not a full or even an adequate picture of the ongoing constitutionalization processes affecting IP. This collection of essays, written by international experts and covering a range of different areas of intellectual property law, takes a broader approach to the process. Drawing on constitutional theory, and particularly on ideas of "new constitutionalism", the chapters engage with the complex array of contemporary legal constraints on intellectual property law-making. Such constraints arising in international intellectual property law, human rights law (including human rights protection for right-holders), investment treaties, and forms of private ordering. This collection aims to illuminate the complex role of this constitutional framework, by analysing the overlaps, complementarities, and conflicts between such forms of protection and seeking to establish the effects that this assemblage of global and regional norms has on legal reform projects and interpretations of IP law. Some chapters take a broad theoretical perspective on these processes. Others focus on specific situations in which the relationship between intellectual property law and broader constitutional norms is significant. These contexts range from Art 17 of the EU's Digital Single Market Directive, to the implementation of harmonized trade secrets protection, from the role of Canada's Charter of Rights to the impact of the social model of property in Brazil.

Epigenetics in Plants of Agronomic Importance: Fundamentals and Applications - Raúl Alvarez-Venegas 2014-07-22

Over the past decades, chromatin remodelling has emerged as an important regulator of gene expression and plant defense. This book provides a detailed understanding of the epigenetic mechanisms involved in plants of agronomic importance. The information presented here is significant because it is expected to provide the knowledge needed to develop in the future treatments to manipulate and selectively activate/inhibit proteins and metabolic pathways to counter pathogens, to treat important diseases and to increase crop productivity. New approaches of this kind and the development of new technologies will certainly increase our knowledge of currently known post-translational modifications and facilitate the understanding of their roles in, for example, host-pathogen interactions and crop productivity. Furthermore, we provide important insight on how the plant epigenome changes in response to developmental or environmental stimuli, how chromatin modifications are established and maintained, to which degree they are used throughout the genome, and how chromatin modifications influence each another.
