the first law of  
thermodynamics the laws of

thermodynamics are deceptively simple to state but they are far reaching in their consequences the first law asserts that if heat is recognized as a form of energy then the total energy of a system plus its surroundings is conserved in other words the total energy of the universe remains constant

thermodynamics in physics is a branch that deals with heat work and temperature and their relation to energy radiation and physical properties of matter to be specific it explains how thermal energy is converted to or from other forms of energy and how

matter is affected by this process thermal energy is the energy that comes from heat

may 6 2019 thermodynamics is the field of physics that deals with the relationship between heat and other properties such as pressure density temperature etc in a substance specifically thermodynamics focuses largely on how a heat transfer is related to various energy changes within a physical system undergoing a thermodynamic process

*laws of thermodynamics wikipedia*  
category the laws of thermodynamics are a set of scientific laws which define a group of physical quantities such as temperature energy and entropy that characterize thermodynamic systems in thermodynamic equilibrium the laws also use various parameters for thermodynamic processes such as thermodynamic work and heat and establish relationships between them
